Abstract

This table corresponds to the unified EoS of neutron star ($npe\mu$) matter at zero temperature and β-equilibrium [1], which is obtained in the framework of Thomas-Fermi approximation and assuming geometrical symmetries for the Wigner-Seitz cells [2]. The covariant density functional DDME-X is adopted [3].

eos.thermo

eos.thermo and the three grid defining files are CompOSE standard data files and by definition available. In eos.thermo, five extra quantities are added, i.e., d, Z, A, R_d, and R_{W}. The quantity d refers to the geometry of the correspondent pasta phase, represented by an integer, with 0 for the uniform phase, 1-slabs, 2-rods, 3-droplets, -2-tubs, and -3-bubbles. The quantities Z and A represent the total proton and nucleon number enclosed within the Wigner-Seitz (WS) cell (for $d = 1$, 2, and -2 a finite cell size $a = 30$ fm is adopted), while R_{d} represents the droplet size and R_{W} the WS cell size.
