## **Abstract**

This table contains the zero-temperature version of the EoS of H. Shen, F. Ji, J. Hu and K. Sumiyoshi [1,2] using a non-linear relativistic mean-field model with the TM1 parametrization [3,4] of the effective interaction. Compared with the original version [5,6], a density dependent symmetry energy has been introduced [4]. Non-uniform nuclear matter is calculated in the single-nucleus Thomas-Fermi approximation with parametrized density distributions in spherical Wigner-Seitz cells. Only neutrons, protons,  $\alpha$  particles and a single heavy nucleus are considered. The present table was taken from the website <http://user.numazu-ct.ac.jp/~sumi/eos/> of K. Sumiyoshi.

## **eos.thermo**

eos.thermo and the three grid defining files are CompOSE standard data files and by definition available. eos.thermo does not necessarily provide all possible data.

table dimension	3
table type	1
total number of grid points	7150

Range and density (#) of the grid parameters:

Quantity	Unit	min	max	#
T Temperature	MeV	0.	0.	1
