

# DD2F-SF quark-hadron model RDF 1.2 with electrons

## EoS Submission Details

EoS name	DD2F-SF quark-hadron model RDF 1.2 with electrons
category	hybrid
submitted by	Niels-Uwe Friedrich Bastian
affiliation	University of Wroclaw
e-mail contact	niels-uwe.bastian(at)uwr.edu.pl
sheet creation date	March 15, 2021

## Abstract

RDF 1.2 is from a set of equation of state models with a first-order phase transition from hadron to quark matter presented in Ref. [1]. This publication focuses on the super-saturated regime and for the treatment of nuclear clusters below saturation on the nuclear statistical equilibrium with excluded volume approach of Hempel and Schaffner-Bielich [2]. The relativistic density function approach, which is used for the high density regime and in particular the string-flip model for quarks was introduced in Ref. [3] with applications to neutron star configurations. The current extension of this model to finite temperature and arbitrary chargefractions was successfully applied to core-collapse supernova simulations [4] and binary neutron star merger simulations [5-7].

On the website of the author<sup>1</sup> you will find further information about the provided data, and the data in different formats. Please feel free to contact the author, if you run into problems with these tabulations.

## Nuclear Matter Properties<sup>2</sup>

	Quantity	Unit	
$n_S$	saturation density in symmetric matter	$\text{fm}^{-3}$	0.149
$E_0$	binding energy per baryon at saturation	MeV	16.02
$K$	incompressibility	MeV	242.7
$K'$	skewness	MeV	168.8
$J$	symmetry energy	MeV	31.67
$L$	symmetry energy slope parameter	MeV	55.04
$K_{sym}$	symmetry incompressibility	MeV	-93.23

## Neutron Star Properties<sup>2</sup>

	Quantity	Unit	
$M_{max}$	maximum mass	$M_{sun}$	2.15
$M_{DU,e}$	mass at DUrca threshold (1/9) w/o $\mu^-$	$M_{sun}$	N/A
$R_{M_{max}}$	radius at maximum NS mass	km	N/A
$R_{1.4}$	radius at 1.4 $M_{sun}$ NS mass	km	N/A

## eos.thermo

eos.thermo and the three grid defining files are ComPOSE standard data files and by definition available. eos.thermo does not necessarily provide all possible data.

```
table dimension          3
table type              1
total number of grid points 1099800
```

Range and density (#) of the grid parameters:

	Quantity	Unit	min	max	#
T	Temperature	MeV	0.1E+00	0.1202264E+03	78
$n_b$	Baryon Nr Density	$\text{fm}^{-3}$	0.1E-11	0.1E+02	235
$Y_q$	Charge Fraction		0.10000000E-01	0.60000000E+00	60

T,  $n_b$ , and  $Y_q$  are stored in eos.t, eos.nb, and eos.yq, respectively.

<sup>2</sup>0-values indicate, that the corresponding data is not provided.

### Further Available Data Files

Files and quantities listed in the following are provided beyond CompOSE's core requirements as outlined in Sec.4.2. of the CompOSE manual.

**eos.compo** : available

index	particle
0	$e^-$
10	n
11	p
4002	${}^2_4\text{He}$
3002	${}^2_3\text{He}$
3001	${}^1_3\text{H}$
2001	${}^1_2\text{H}$
500	u
501	d
	- end of table -

The listed particle number fractions are net fractions, i.e., they are given by the difference between the corresponding particle and anti-particle fractions. Further particle sets are defined.

index	description
999	Average fraction, mass and proton number for all nuclei not listed above
	- end of table -

**eos.micro** : available

index	quantity	particle
10041	Dirac effective mass divided by particle mass $m_i^D/m_i$	n
11041	Dirac effective mass divided by particle mass $m_i^D/m_i$	p
500041	Dirac effective mass divided by particle mass $m_i^D/m_i$	u
501041	Dirac effective mass divided by particle mass $m_i^D/m_i$	d
10051	relativistic vector self-energy $V_i$	n
11051	relativistic vector self-energy $V_i$	p
500051	relativistic vector self-energy $V_i$	u
501051	relativistic vector self-energy $V_i$	d
	- end of table -
